Barbastelle bat facts

- They have white hairs that grow on their lips and this is what gives it
 its scientific name Barbastella which translates to star beard.
- One colony can live in up 30 old trees.
- At three weeks old can fly and at six they forage themselves.
- They weigh 6 to 13.5 grams.
- They can only open their mouths a small amount so eat small insects such as small moths and flies, but also sometimes spiders.
- They like to live in woodland with broadleaf species, and will live in hollow trees, tunnels and underground.
- Bats knees bend the opposite way to humans. This is so that they can cling on to surfaces without banging their knees.
- Bats hang upside down when resting; the weight of their bodies pulls their tendons, attaching their toes to the surface they are hanging from. This stops them from falling off whilst asleep.
